

User Acceptance Testing (UAT) emphasizes end to end testing of the SACWIS application accomplished by executing user driven test scenarios and business flow driven test cases.

UAT validates the SACWS application for Functionality being delivered, Usability and System's performance during normal business operations. This is accomplished using a set of test cases, which are developed based on design artifacts such as the use cases and also based on certain specific user driven scenarios/flows.

During UAT, the following major areas of the Ohio SACWIS sub-system will be tested: Intake Management; Case Management & court Processing; Resource Management; Administration; and Financial, Eligibility, and Interface.

The test cases and business flows will test web pages, forms, reports, notices, notifications and other essential system parts, which are part of the SACWIS sub-systems.
